

Delivery by time/distance

Thank you for your purchase!

Summary

Informations	1
Configuration step by step	2

Set up

2 options are available for you in the modules tab of your PrestaShop back office:

- Log in to your PrestaShop Addons account with which you purchased the module.
- Use the option to install a module from your computer. Simply select the zip file you downloaded on PrestaShop Addons and confirm.

It will then appear in the list of modules available for installation.

This module uses the HERE API to calculate distances. You must first create a project on [HERE.com](https://here.com) to get an API key (select REST but do not enable the "trusted domain" setting). HERE offers a very wide free use quota that should largely cover your needs.

CONFIGURATION

FOLLOW THE GUIDE!

After getting your API key on here.com (see page 1), fill them out in the settings section of the module.

Once done, you can create your carriers. To do this, simply click on the small + at the top right of the carriers section of the module.

Different settings are available to you:

Latitude and Longitude: The distance or time is calculated from a starting point, usually your shop or warehouse. To calculate this distance or time, you need the latitude and longitude of this starting point. You can find this latitude and longitude on <https://www.latlong.net/>

Billing: 4 billing modes are available to you: per unit of distance, time, distance ranges, or time ranges.

For units of distance or time, the value will simply be multiplied by the price you entered (ex: 2km x 3€ = 6€).

For ranges, you can set the price you want for the ranges you want (ex: 3€ from 0km to 5km or 2€ from 5min to 10min).

Distance and time max: You will most certainly want to block the delivery from a certain distance or a certain time. The carrier will simply not be available if the customer is too far away.

Price mode: If you do not select an invoicing by range, your prices will be calculated automatically and can give very precise values (ex: 12,56€). These values can be rounded to the nearest value (eg 13€ for 12,56€ or 12€ for 12,14€).

You also have the option of using a psychological price. After rounding, 1 cent is withdrawn (ex: 12,99€ for 12,56€).
